PALANTIR FOUNDRY

# Your First E2E Workflow

Step-by-step guide to building a unified operational dashboard

## What You'll Build

01 **Project Setup**
Upload CSVs from two IT systems

02 **Data Pipeline**
Clean, join, and union order data

03 **Ontology**
Create a searchable Order object type

04 **Workshop App**
Build an interactive order management UI

05 **Actions**
Enable one-click order assignment

USE CASE OVERVIEW

# The Business Problem

Office Goods Corp acquired Bureau SAS, leaving two separate IT systems causing critical order tracking issues. The fulfillment department needs a single unified tool to manage orders across both systems.

### Office Goods System

- orders_office_goods.csv
- Uses orderId, dueDateTime fields
- Linked to customer master data

### Bureau SAS System

- orders_bureau_transactional_system.csv
- Uses order_id, order_due_date fields
- Different customer ID scheme

✅ **Solution: Build a unified Foundry pipeline that combines both datasets into one operational dashboard with 1,492 orders**

SOLUTION ARCHITECTURE

# End-to-End Data Flow

### Raw Data Ingestion

3 CSV files uploaded to Foundry

1

### Pipeline Builder

Clean, join & union datasets

2

### Ontology Layer

Order object type created

3

### Workshop App

Interactive UI for fulfillment

4

Output: 1,492 unified orders | 11 properties per order | Real-time action support via Ontology edits

STEP 1 — DATA TRANSFORMATION

# Pipeline Builder: Clean, Join & Union

## Transformation Steps

**1** **Clean Bureau Data**

Cast order_due_date to Timestamp
Filter null order_id
Normalize column names

**2** **Clean Office Goods**

Cast dueDateTime to Timestamp
Filter null orderId
Rename dueDateTime → order_due_date

**3** **Join with Customers**

Join each dataset to consolidated_customers on matching customer_id fields

**4** **Union All Orders**

Combine both cleaned datasets into all_orders (1,492 rows)

## Output Schema: all_orders

11 columns • 1,492 rows

| | |
|---|---|
| order_id | order_due_date |
| item_name | days_until_due |
| status | customer_id |
| assignee | consolidated_customer_id |
| quantity | customer_name |
| unit_price | |

STEP 2 — ONTOLOGY CREATION

# Creating the Order Object Type

## Object Configuration

| | |
|---|---|
| Object Name | **Order** |
| Backing Dataset | **all_orders** |
| Primary Key | **Order Id** |
| Title Property | **Item Name** |
| Edits Enabled | **Yes — write-back enabled** |
| Status | ✅ **Indexed successfully** |

## Object Properties (11)

| | |
|---|---|
| order_id | order_due_date |
| item_name | days_until_due |
| status | customer_id |
| assignee | consolidated_customer_id |
| quantity | customer_name |
| unit_price | |

STEP 3 — WORKSHOP APPLICATION

# Orders Inbox — UI Components

## 🔍 Filter Panel

Collapsible side panel with multi-select dropdowns for all 10 properties. Outputs 'Order Filters' variable.

## 📊 Charts Section

Pie chart: Orders by Status. Bar chart: Orders by Days Until Due, segmented by Status.

## 📋 Orders Table

Full table of filtered orders with 11 columns, sorted by Item Name. Linked to filter output.

## 🪟 Detail Panel

Shows selected order properties + Assign button that triggers the action form.

Application Title: "Orders Inbox" • Icon: Cube, Color: Blue 4 • Fully responsive layout

STEP 4 — ACTIONS & TESTING

# Assign Order Action + Validation

## Assign Order Action

| | |
|---|---|
| Action Type | **Modify Object(s)** |
| Target Object | **[username] Order** |
| Assignee Field | **User input text field** |
| Status Field | **Static value: 'assigned' (hidden from form)** |
| Permissions | **Current user only** |
| Trigger | **Auto-populates from selected row** |

## ✅ Test Results

- **Test Order ID: 8d64e941-799c...c206b101**
- Changed assignee: Alfredo Birns → Gail Weber
- Action submitted successfully
- Table updated in real time
- Status automatically changed to 'assigned'

## User Workflow

1. Filter orders
2. Select an order
3. View details
4. Click Assign
5. Status updates

NEXT STEPS & ENHANCEMENTS

# What to Build Next

### Live Data Feeds

Replace CSV uploads with live connections to transactional systems

### Email Notifications

Auto-notify assignees when orders are assigned to them

### Comments Section

Add collaborative notes and status updates per order

### Role-Based Access

Restrict actions based on user roles and teams

### Audit Trail

Log every change to track who modified what and when

### Write-Back

Push updates back to source transactional systems
