

Introduction to

Palantir Foundry & AIP

Enterprise Data Operations & AI Platform

Presented by

Rajesh Pasham

PALANTIR

TRAINING

Course Agenda

What we'll cover today

01

Why Foundry & AIP?

The problem space & traditional data flow challenges

02

The Ontology

The centerpiece — Objects, Links & Business Logic

03

Data Integration

Seamless connectivity across all data sources

04

Model Connectivity

Linking analytical models to real-world workflows

05

Analytics

Real-time exploration, BI dashboards & collaboration

06

App Building & Workflows

Rapid development for all skill levels

07

Integrations & Development

APIs, OSDK and external connectivity

08

Palantir AIP

Connecting generative AI to enterprise operations

Why Do Foundry & AIP Exist?

The Problem Space

Data Silos

Organizations have vast data dispersed across multiple systems — CRMs, ERPs, data lakes — with no unified view.

Linear Flow Gaps

Traditional assembly-line data flows fail to capture learnings, materialize decisions, or provide feedback loops.

No Operational Loop

Disconnect between front-line operations and back-office analytics prevents continuous improvement and innovation.

The Foundry Approach

Operational Connectivity — a dynamic, integrated data ecosystem

Operationalizing Data

Integrates operations with data & analytics, making data accessible and actionable for everyone in the organization.

Empowering All Users

Democratizes data insights across all roles — not just data scientists — enhancing collaboration and efficiency.

Interoperability

Connects diverse data sources, breaking down silos and promoting seamless data flow between producers and consumers.

Common Language

Enforces a unified Ontology early in the process, standardizing data interpretation across all teams.

Central Secure Hub

Serves as a central hub supporting two-way interactions with granular data permission controls.

Iterative Development

Iterate on production data and build tools quickly while ensuring strict data governance and integrated tooling.

SECTION 1

The Ontology

The Centerpiece of Foundry

Ontology = Data + Models + Business Logic

The Ontology: Core Concepts

A semantic layer that translates complex data into familiar business terms

What is the Ontology?

The Ontology is a semantic layer that models a company's data to ensure it is usable and understandable by all business users.

It bridges the gap between complex data from various source systems and the business logic, translating it into familiar business terms.

Provides a single source of truth for data-driven operations and decision-making.

Objects

Unique entities: banks, cashflows, people, clients, contracts, policies — the building blocks of the Ontology.

Links

Connect objects to reflect business activities — e.g., a contract linked to a client linked to cashflows.

Curated Access

Granular access rights configured per user role — controlling who can read or modify each object and link.

Recap: Ontology = Data + Models + Business Logic — a unified, clean, structured representation of your business

Data Integration

Seamless Connectivity and Federation of Data Sources

Company-Wide Integration

- ✓ Integrates CRM systems like Salesforce
- ✓ Connects in-house / homegrown systems
- ✓ Enables data federation — no duplication
- ✓ Data remains consistent & up-to-date

Native Connectors & Tools

- ✓ SAP, Snowflake, DataBricks, Amazon S3
- ✓ Structured & unstructured data sources
- ✓ IoT & commercial data source connectors
- ✓ Low-code and pro-code pipeline tools

Model Connectivity

Collaborative Training & Validation

- ✓ Train or validate models on real data
- ✓ Collaborative: data scientists, producers & end users
- ✓ Operational tools connect models directly to workflows
- ✓ Insights are immediately actionable

Agnostic Technology Integration

- ✓ Home-grown predictive & forecasting models
- ✓ State-of-the-art Large Language Models (LLMs)
- ✓ Technology-agnostic platform
- ✓ Integrates any modeling platform

Model Integration Examples

- ✓ TensorFlow, scikit-learn (in-platform)
- ✓ Containerized models via Docker registry
- ✓ Keras, PyTorch, Scikit-learn (pro-code)
- ✓ OpenAI, VertexAI, Sagemaker (external)

Recap: Model Connectivity = Seamless Integration of Analytical Models with Data and Workflows

Analytics

Real-Time Exploration, Dashboards, and Secure Collaboration

Comprehensive Analytics Workbench

Foundry's analytics capabilities provide a comprehensive suite of tools for users from data scientists to business analysts.

Real-time data exploration, dashboard creation, and report generation — all with robust collaboration and security built in.

Investigate data, explore trends, and create visualizations for data of all scales.

BI Dashboards & Reports

- ✓ Low-code / no-code dashboard creation
- ✓ Customizable reports to meet specific needs
- ✓ Share insights with one click
- ✓ Respects data access rights & permissions
- ✓ First-class security standards maintained

App Building & Workflows

Ontology-Aware Apps

Suite of applications operating natively on the Ontology. Capture decisions via write-back, ensuring insights and actions are integrated into the data ecosystem.

Speed to Value

Leverage out-of-the-box workflow templates or reusable components to build applications quickly — often within days.

All Skill Levels

No-code, low-code, and pro-code frameworks — empowering business analysts and developers alike to build and customize.

Scenario Simulation

Built-in 'what-if scenario' modeling. Simulate impact of varying parameters on KPIs. Results can be materialized back into data once validated.

Recap: App Building = Rapid Guard-Railed Development for all skill levels

Integrations & Development

Integration Methods

API-Driven Development

Automatic API generation for all Ontology elements. Simplifies platform connectivity.

Third-Party Auth Framework

Secure integrations conforming to granular policies — maintaining data integrity.

Streaming & Batch Connectors

Export plugins for both streaming and batch data flows.

Webhooks

Enable write-backs to external systems using data connection tasks.

External Transforms

Data transformations outside Foundry with results integrated back in.

Ontology SDK (OSDK)

Accelerated Development

Read & write to the Ontology with minimal code — build custom React apps on top.

Strong Type-Safety

Functions and types based on the specific Ontology subset needed per application.

Centralized Maintenance

Central Ontology development reduces maintenance burden across applications.

Secure by Design

Scoped tokens per application plus user's own data permissions.

Supports: TypeScript (NPM) · Python (Pip/Conda) · Java (Maven) · Any (OpenAPI)

SECTION 7

Palantir AIP

Foundry + Generative AI

Connecting AI to Enterprise Operations

Palantir AIP: Components & Capabilities

A logical extension of Foundry — integrating GenAI into operations with governance

AIP as Foundry Extension

- ✓ AI capabilities in Automate, Workshop, Pipeline Builder
- ✓ LLM-backed workflows without development complexity
- ✓ Supported: LLAMA, GPT, Claude & more
- ✓ Same security model as entire Foundry platform

AIP Logic

- ✓ No-code environment for LLM-powered functions
- ✓ Intuitive prompt engineering interface
- ✓ Test, evaluate & monitor LLM outputs
- ✓ Set up automation leveraging the Ontology

Helpers for Builders

- ✓ AIP Assist: LLM-powered platform navigation
- ✓ In-platform LLM assistance for daily workflows
- ✓ AIP Logic Evaluations: track function quality
- ✓ Governance: model availability & resource monitoring

Recap: AIP = Foundry + GenAI — Seamlessly integrating generative AI into operational workflows & decision-making

The Palantir Platform Stack

Eight core capabilities to bring Data & AI to production at scale — safely and securely

Key Takeaways

What to remember from this course

01

Ontology is the Heart

The Ontology = Data + Models + Business Logic — a semantic layer that makes data usable for everyone.

03

Models are Connected

Technology-agnostic model connectivity links analytical models to real-world data and operational workflows.

05

Rapid App Development

No-code to pro-code app building with scenario simulation and write-back capabilities built in.

02

Data Integration = Federation

Foundry connects diverse sources without duplication, with native connectors for SAP, Snowflake, AWS S3 and more.

04

Analytics for Everyone

Real-time exploration, BI dashboards, and secure collaboration — for data scientists to business analysts.

06

AIP = Foundry + GenAI

AIP seamlessly integrates generative AI into operations with governance, enabling AI-powered decision workflows.

Ready to Start?

You're now prepared to begin hands-on Foundry & AIP training!

Next Steps

- ✓ Hands-on platform exploration
- ✓ Building your first Ontology
- ✓ Creating pipelines & dashboards
- ✓ Deploying AI-powered workflows
